DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-4 rejected under 35 U.S.C. 103(a) as being unpatentable over Zhang (6,855,954) in view of Lin (5,864,150)

Regarding Claims 1-4, Zhang discloses a thin film transistor and liquid crystal display having the thin film transistor where in Fig. 1C it is disclosed a gate 4 disposed on the substrate, a gate dielectric layer 6 disposed on the gate, a pattern semiconductor layer 8, a patterned, silicon dioxide or silicon oxide, insulating layers 10 and 11 and an ohmic layer (p or n type) 12 disposed on the silicon layer. Passivation layer 14 covers insulating layers 10 and 11. Zhang fails to disclose the required configuration where the central portion of the channel semiconductor layer is polysilicon and the side portions are amorphous. However, Lin discloses a hybrid polysilicon/amorphous silicon TFT and method of fabrication where layer 50 includes a polysilicon center channel portion and amorphous side portions as shown in Fig. 7 and claim 1. (Examiner considers the amorphous side portions of layer 50 in Fig. 7 of Lin to be "hot carrier restraint portion" since carriers act slower in the amorphous silicon layer as compared to the polycrystalline silicon/polysilicon layer.)

It would have been obvious to one of having ordinary skill in the art at the time the invention was made to include the required polysilicon center portion and the amorphous side portions for the channel region in Zhang as taught by Lin. in order to have a thin film transistor structure with increased reliability.

Regarding Claim 2, passivation layer is labeled as 14 in Zhang Fig. 1C

Regarding Claim 3, ohmic contact layer 12 of Zhang Fig. 1C is either n or p type

Regarding Claim 4, insulating layer 6, 10 and 11 are disclosed to be either silicon oxide or silicon nitride in Zhang as disclosed in column 1
